Data Analytics Process: Real World Application

Freelancing And use of 6 steps Data Analytics process

Freelancing

Freelancing means simply working on our own without any boss on our head. Where we have freedom to work from anywhere at any time.
In this freelancers have to communicate with the clients for their requirements and work accordingly and complete the project before deadline.

We can use Data Analytics in Freelancing for analyzing the data of the clients and the projects submitted to those clients,advertising cost,scope of connections and the revenue or amount received.And we are able to apply the steps of data analytics and work on it and can improve our working process.

Data Analytics Process

01 Plan

02 Prepare

03 Process

04 Analyze

05 Share

06 Act

01

Plan

As a freelancer first we decide what technologies or domain we are actually going to work in before going to the clients requirements.Whether it is Android Development,Web Development,Logo Designing,Content Writing,etc

02 Prepare

We need to prepare or check the draft cost to be set for a particular work accprding to the client requirement that for android development cost will be at high,etc

Process

03

In process step we actually understand the client requirements and collect the data needed for the given requirements.Like if client want a web development then for what actually he/she want- ekart/restraurant/college/school/bank,etc.

04

Analyze

We start analyzing the requirements and calculate the time/period required to complete the project/task,what should be the compensation of the particular work done.Also whether using a particular language for development. For e.g:-For web development whether javascript will be preferred or node.js,etc would be preferred mostly.

05 Share

In freelancing we actually communicate with the client and tell him/her that the methodology of the reaching to their requirements is in this particular way and give them a idea of actual work that would be done by us to meet their requirements .

Act

06

Act is a final step in data analytics where we start actual working on project when client agree for the time period and cost required to complete the project. And Finally hand it over to the client.

THANKS!
